

I am a tax payer and amateur radio operator. Measurements taken on on-going BPL trials strongly indicate that BPL implementations create significant radio frequency interference in the high frequency communications bands. Testing indicates a level of interference that is disruptive to communications by all users of the HF spectrum which include government agencies, aviation, emergency communications, and amateur radio. I urge the FCC to carefully consider any action that would result in any BPL implementation until exhaustive testing can be conducted and satisfactory measures developed to eliminate said interference.
